## Preface

This document provides the Signal and the Data Structure for Messaging service using IRNSS spacecraft. The document addresses the signal modulations, the frequency band, the received power levels, the data structures, their interpretations etc. This document also provides the encoding and decoding schemes for different information and warning messages generated by INCOIS viz. Potential Fishing Zones/TUNA-PFZ; High Waves, Cyclones and Tsunami alert messages.

## Terms of Use & Disclaimers

The Signal-in-Space ICD for messaging service is released to the public to provide the essential information to facilitate IRNSS signals for messaging-based applications, according to the terms and conditions specified hereafter:

- The publishing authority does not make any assurance on the fitness of the information furnished in the document for any specific purpose. The contents of the document are only for information and the publishing authority does not assume any legal liability for any product developed based on the information. No liability is hereby assumed for any consequences arising out of the usage of the information contained in the SIS ICD for messaging service.
- The SIS ICD for messaging service shall not be reproduced or transmitted, partly or wholly, in electronic or print medium without the consent of the publishing authority.
- The information furnished in the IRNSS SIS ICD for messaging could be subject to modification and update. Although the publishing authority shall make its best efforts to notify the public about the updates in the ICD, it does not assume any obligation to advise any person or organization on its future updates of SIS ICD for messaging service.

## INTRODUCTION

The Signal-in-space ICD for messaging services provides the information on INCOIS messages broadcast via the NavIC messaging service offered by ISRO using IRNSS spacecraft. The messaging services are provided to users within Indian region using the IRNSS ground segment and the IRNSS spacecraft. This ICD specifically provide the messages broadcasted by INCOIS, and its encoding and decoding mechanism. IRNSS spacecraft broadcasts messages in L5 band frequency.

## SCOPE OF THE DOCUMENT

The Signal and the Data Structure for messaging service specifies the interface between the IRNSS spacecraft and the user segment for messaging service. The document provides necessary information for receiver design to decode the messages being transmitted by IRNSS Spacecraft. This document does not address the implementation of applications utilizing the decoded message data. The decoding scheme for the message data has been provided in the annexures for each type of warning / information messages broadcast by INCOIS such as cyclone warning, high wave alert, Potential Fishing Zone/TUNA-PFZ and tsunami warning.

## 1. SIGNAL OVERVIEW

### 1.1 SPACECRAFT CARRIER FREQUENCY

The messaging service signals are broadcast in L5 band frequency. The carrier frequency and the bandwidth of transmission for the messaging service are shown in Table 1.

**Table 1: Carrier Frequency and bandwidth**

| Signal | Carrier Frequency | Bandwidth                      |
|--------|-------------------|--------------------------------|
| L5     | 1176.45 MHz       | 24 MHz (1164.45 - 1188.45 MHz) |

### 1.2 MODULATION SCHEME

The signal is BPSK (1) modulated on L5 band. The navigation data at data rate of 50 symbols per second (1/2 rate FEC encoded) is modulo 2 added to PRN code chipped at 1.023 Mcps. The CDMA modulated code, modulates the L5 carrier at 1176.45MHz.

### 1.3 RECEIVED POWER LEVELS ON GROUND

#### 1.3.1 Nominal Levels

Table 2 indicates the assured power levels of the signals received by a user receiver on ground. The received power on ground is measured at the output of an ideally matched RHCP 0 dBi user receiving antenna when the spacecraft elevation angle is higher than 5°.

**Table 2: Nominal received power of signals**

| Signal | Signal Component | Nominal Received Power (dBW) |
|--------|------------------|------------------------------|
| L5     | BPSK(1)          | -159.0                       |

### 1.4 POLARIZATION CHARACTERISTICS

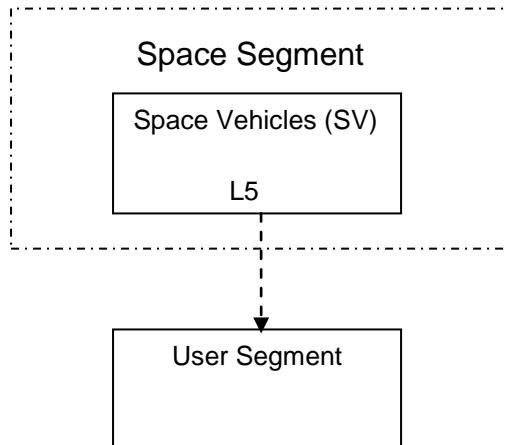

Signals are Right Hand Circularly Polarized. The antenna axial ratio does not exceed 2.0 dB.

## 2. USER SEGMENT

The User segment mainly consists of:

- Receiver capable of receiving signal at L5 band frequency.

Figure 1 specifies the radio frequency interface between space and user segments. The Spacecraft provides signals in L5 band.

**Figure 1: Space Segment Interface with User Segment**

### 3. PRN CODES

The IRNSS spacecrafts utilize Gold codes for the signal. The codes are generated using Linear Feedback Shift Registers. The code lengths for the signal is listed in Table 3.

**Table 3: Code lengths of signals**

| Code Length (ms) | No. of Chips |
|------------------|--------------|
| 1 ms             | 1023         |

#### 3.1 PRN CODES

The initial conditions for generation of PRN Codes for IRNSS satellite is as given in Table 4. The length of each code is 1023 chips. The code is chipped at 1.023 Mcps.

##### 3.1.1 Code Generation

For code generation, the two polynomials G1 and G2 are as defined below:

$$G1: X^{10} + X^3 + 1 \text{ and } G2: X^{10} + X^9 + X^8 + X^6 + X^3 + X^2 + 1$$

The G1 and G2 generators are realized by using 10 bits Maximum Length Feedback Shift Registers (MLFSR). The G1 register is initialized with all bits as '1'. The initial state of G2 register is provided in Table 4. G1 and G2 are XOR'ed for the generation of the final 1023 chip long PRN sequence. The time period of the PRN sequence is 1 millisecond.

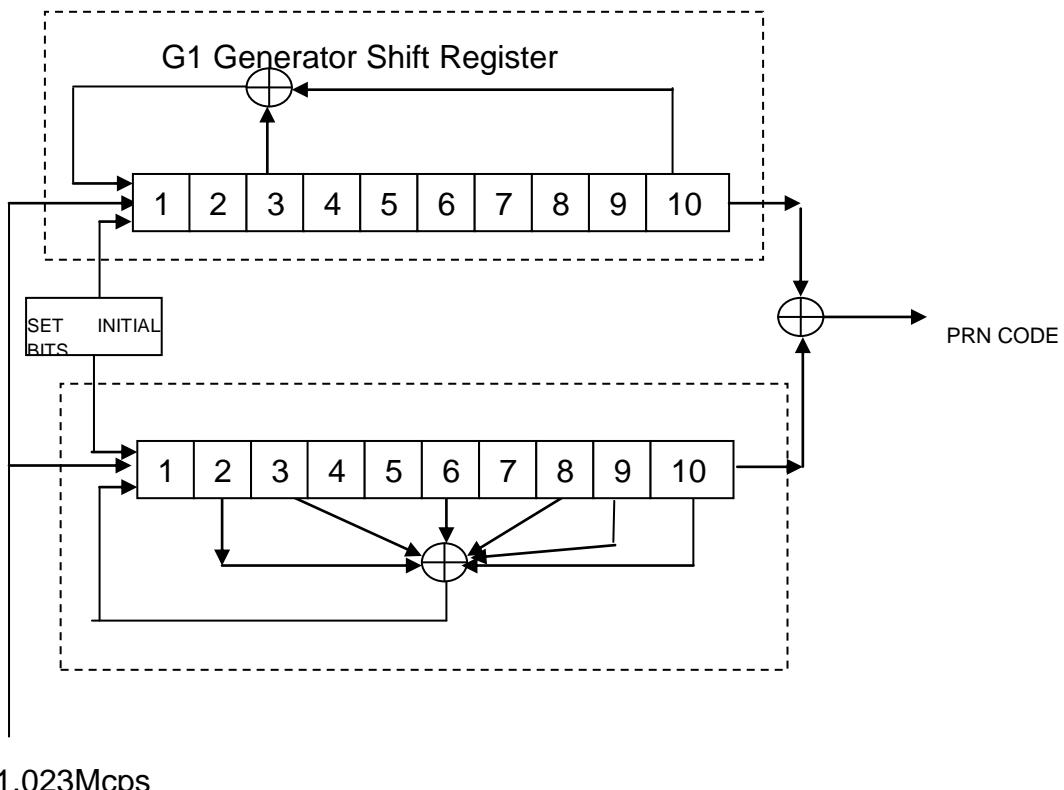

**Table 4: Code Phase assignment**

| PRN ID | Initial Condition for G2 Register | First 10 Chips in Octal2 |
|--------|-----------------------------------|--------------------------|
| 1      | 1110100111                        | 0130                     |
| 2      | 0000100110                        | 1731                     |

|   |            |      |
|---|------------|------|
| 3 | 1000110100 | 0713 |
| 4 | 0101110010 | 1215 |
| 5 | 1110110000 | 0117 |
| 6 | 0001101011 | 1624 |
| 7 | 0000010100 | 1753 |
| 8 | 0100110000 | 1317 |
| 9 | 0010011000 | 1547 |

**Note: Currently PRN ID-1 is being used for messaging service.**

The Figure below shows the generation of code.

**Figure 2: PRN Code Generator**

#### 4. DATA STRUCTURE

The Signal-In-Space transmits messages in L5 band. Data is transmitted in sub-frames of 600 symbols transmitted at 50 symbols per second. Sub-frame has 16 bit Sync word followed by 584 bits of interleaved data. The sub-frame format is shown in Figure 3.

| 600 symbols |             |
|-------------|-------------|
| Sync code   | Subframe    |
| 16 bits     | 584 symbols |

**Figure 3 : Subframe Structure**

The 584 symbols of interleaved data are obtained from FEC encoding 292 sub-frame bits.

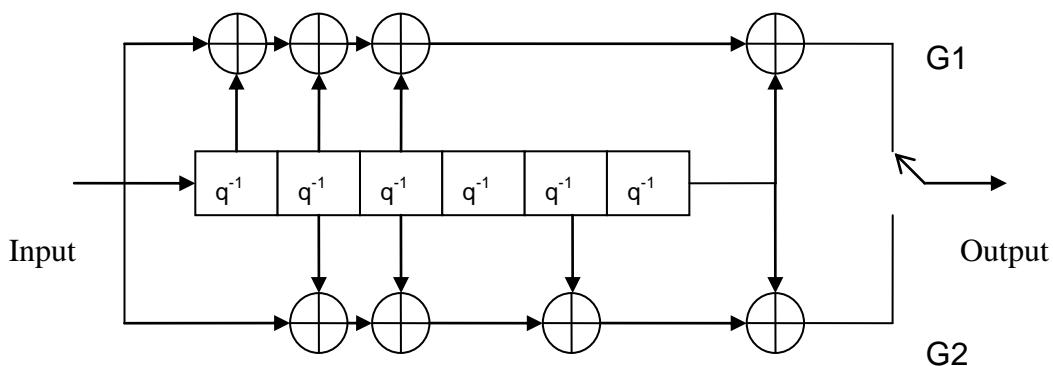

#### 4.1 BIT AND BYTE ORDERING CRITERIA

The following bit and byte ordering criteria will be used while formatting the data:

- The most significant bit/byte is numbered as bit/byte 1
- The most significant bit/byte is transmitted first

#### 4.2 FEC ENCODING

The sub-frame of 292 bits is rate 1/2 convolution encoded and clocked at 50 symbols per second. Figure 4 depicts the convolution coding scheme

**Figure 4: FEC Encoding**

The convolution encoding for the data is performed as per the parameters given in Table 5.

**Table 5: FEC encoding parameters**

| Parameter            | Value                      |
|----------------------|----------------------------|
| Coding Rate          | $\frac{1}{2}$              |
| Coding Scheme        | Convolution                |
| Constraint Length    | 7                          |
| Generator Polynomial | G1 = (171)o<br>G2 = (133)o |
| Encoding Sequence    | G1 then G2                 |

Each sub-frame of 292 bits, after encoding, results in 584 symbols.

#### 4.3 INTERLEAVING

The 584 symbols of FEC encoded data is interleaved using a block interleaver with n columns and k rows. Data is written in columns and then, read in rows. Table 6 indicates the interleaving mechanism.

**Table 6: Interleaving parameters**

| Parameter  | Arrangement |
|--|-------------|
| Block Interleaver size                                 | 584         |
| Block Interleaver Dimensions ( $n$ columns x $k$ rows) | 73 x 8      |

#### 4.4 SYNC WORD

The Synchronization pattern for each of the sub-frame is 16 bit word. The Synchronization word is not encoded. The synchronization pattern allows the receiver to achieve synchronization to the sub-frame. The Sync pattern is EB90 Hex.

#### 4.5 TAIL BITS

The tail bit field consists of 6 zero value bits enabling completion of the FEC decoding of each sub-frame in the user receiver.

#### 4.6 CYCLIC REDUNDANCY CHECK (CRC)

The data signal contains parity coding according to the following conventions. CRC – 24Q polynomial shall be used for each Sub frame, applied on the first 262 bits of the sub-frame. Twenty-four bits of CRC parity will provide protection against burst as well as random errors with a probability of undetected error  $\leq 2^{-24} = 5.96 \times 10^{-8}$  for all channel bit error probabilities  $\leq 0.5$

The generator polynomial is given as

$$g(X) = \sum_{i=0}^{24} g_i X^i$$

$$\begin{aligned} g_i &= 1 \text{ for } i \text{ equal to } 0, 1, 3, 4, 5, 6, 7, 10, 11, 14, 17, 18, 23, 24 \\ &= 0 \text{ otherwise} \end{aligned}$$

#### 4.7 SUB FRAME STRUCTURE

Each Sub-frame is 292 bits long(without FEC encoding and Sync Word). The start of each sub-frame is with TLM word of 8 bits. Each sub-frame ends with 24 bit CRC followed by 6 tail bits. The sub frame structure for satellite ID 1 is as given below:

| 1         | 9          | 26        | 27 | 28 | 29        | 30          | 31         | 37   | 257       | 263        | 287       |
|-----------|------------|-----------|----|----|-----------|-------------|------------|------|-----------|------------|-----------|
| TLM       | TOWC       | RESERVED  |    |    |           |             | MESSAGE ID | DATA | RESERVED  | CRC        | Tail      |
| 8<br>BITS | 17<br>BITS | 5<br>BITS |    |    | 6<br>BITS | 220<br>BITS |            |      | 6<br>BITS | 24<br>BITS | 6<br>BITS |

Figure 5: Structure of Sub-frame

#### 4.7.1 TLM

The 8 bits of TLM word are reserved for future.

#### 4.7.2 Time of Week Count (TOWC)

The time of week counter (TOWC) indicates the number of 12 second counts at which the next subframe will begin. It is represented in 17 bits. The Time of Week Count (TOWC) value ranges from 1 to 50400 to cover one entire week. The Time Of Week (TOW) in seconds is obtained by multiplying TOWC with 12. The TOWC will have a value of 1 at week change over (Changeover from Saturday to Sunday). To derive current time the receiver shall subtract 12 from TOW. As the TOWC is always initialized at the beginning of week, the continuous time keeping if required, is to be done at the user receiver end. Refer Annexure 1 for additional information on computation of IST/UTC from TOWC.

If the user receiver needs absolute date-time, it is expected by user / application to provide the absolute date-time at start up giving details on week number; or year, month and day as part of user data.

#### 4.7.3 Reserved

The bits 26 to 29 & 257 to 262 are reserved.

#### 4.7.4 Message ID

Each message in the frame has a 6-bit identifier that uniquely identifies the Message ID in the frame. Each messaging service broadcaster will be allocated a unique Message ID. The allocated message ID is to be used for decoding the relevant messages.

### 5. SUBFRAME FEATURES

#### 5.1 Idle Pattern

When there is no valid data available on board for a given message ID, Idle Pattern containing alternating zeroes and ones is transmitted in the data part of the navigation sub-frames of IRNSS. Idle pattern shall begin from bit 37, the first bit being a zero. When idle pattern is transmitted the CRC will be corrupted for the corresponding sub-frame and the sub-frame shall be ignored.

## 5.2 Null Message

A message with message ID 0 is defined as Null message and shall be ignored by user.

## 6. MESSAGES

A message segment in a sub-frame is of length 220 bits. A message ID may contain multiple segments of messages (each 220 bits long). The decoding scheme for a given message ID shall be provided by the respective message broadcaster. 64 different message IDs are available in the messaging service.

## 7. MESSAGING USER RECEIVER

The user receiver needs to acquire, track, and demodulate signals as per the ICD. The receiver shall provide the 220 bit message along with TOWC, Message ID as output to the user. The Message ID shall be used to decode the message by the receiver. The receiver shall have the provision to accept Message ID as inputs in order to identify and provide only the corresponding message for a given user.

## 8. INCOIS MESSAGES

INCOIS is providing various type of warning and information messages service to the user in India. The warning messages include:

1. Tsunami
2. Cyclone Warning
3. High wave

The warning messages are given the **Message ID 21**.

The different types of warning messages can be identified using unique service ID broadcast in the sub frame as part of the message.

**Table 7: Service ID**

| Service         | Service ID |
|-----------------|------------|
| High wave       | 0111       |
| Cyclone Warning | 1111       |
| Tsunami         | 0011       |
| No Warning      | 1100       |

In addition to warning messages INCOIS broadcasts Potential Fishing Zone (PFZ) / TUNA-PFZ information to the fishermen in India. The PFZ/TUNA-PFZ message has a **Message ID 20**.

## ANNEXURE 1- Computation of Indian Standard Time (IST) using TOWC

The receiver shall compute time from TOWC value broadcast in the sub-frame. The time of week counter (TOWC) indicates the number of 12 second counts at which the next sub-frame will begin. The Time of Week Count (TOWC) value ranges from 1 to 50400 to cover entire week. Steps to compute time:

1. Read TOWC value from sub-frame data.
2. Multiply TOWC with 12 to obtain the Time Of Week (TOW) value in seconds.  
(The TOWC will have a value of 1 at 00:00:00 hrs, UTC on Sunday)
3. Subtract 12 seconds to compute the time of broadcast of the current sub-frame.
4. Compute the day, hours, minutes and seconds that has elapsed from Sunday, using the TOW value in seconds. This shall provide the time in UTC.
5. Add 5hrs 30 mins to the time computed in Step 4 to obtain the time in IST.
6. The user shall feed the year, month and date information as part of user data. As the TOWC is always initialized at the beginning of week, the continuous time keeping is required to be done at the user receiver end.

### Example

|  |                      |
|--|----------------------|
| TOWC value                                     | = 24843              |
| Time of week in Seconds                        | = 24843 x 12 seconds |
|  | = 298116 seconds     |
| Time of week at the start of current sub-frame | = 298116-12 seconds  |
|  | = 298104 seconds     |

*Hence, No. of seconds elapsed since 00:00:00 hrs (UTC) on Sunday are 298104 seconds*

|  |                              |
|--|------------------------------|
| No. of days elapsed from start of Sunday | = 298104 / 86400             |
|  | = 3.4502778 days (Wednesday) |

### Time of day

|       |                   |
|-------|-------------------|
| Hours | = 0.4502778 x 24  |
|       | = 10.806667 hours |

|         |                 |
|---------|-----------------|
| Minutes | = 0.806667 x 60 |
|         | =48.4 minutes   |

|         |              |
|---------|--------------|
| Seconds | = 0.4 x 60   |
|         | = 24 seconds |

|             |               |
|-------------|---------------|
| Time in UTC | =10:48:24 hrs |
|             |               |

|             |                        |
|-------------|------------------------|
| Time in IST | = 10:48:24 + 05:30 hrs |
|             | = 16:18:24 hrs         |

**Day & Time in IST: Wednesday, 16:18:24 hrs**

## ANNEXURE 2- INCOIS High Wave alert message

The High wave alert early warning message contains information like region, Location, wave height, wave period and Duration.

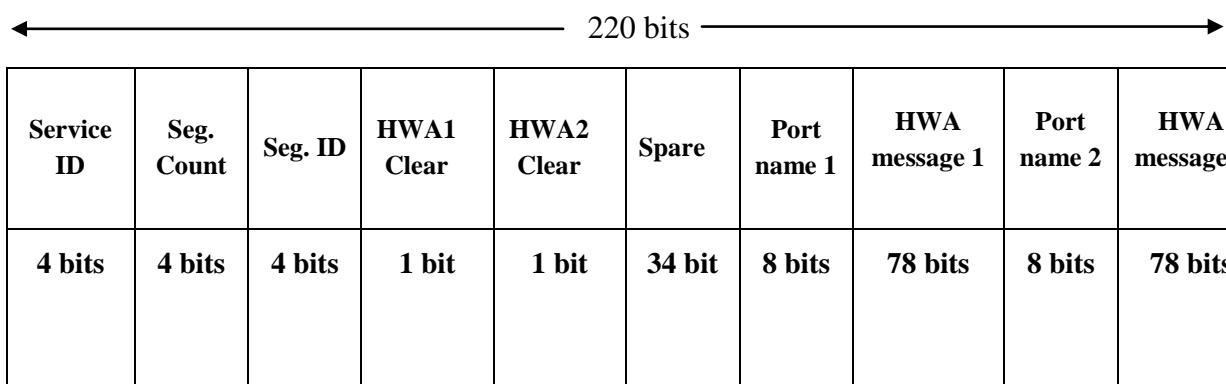

The IRNSS message structure for transmitting the alert messages is given below:

**Table 1: Sub frame data structure**

| 1      | 9       | 26       | 27 | 28 | 30 | 31         | 37       |  | 257          | 263     | 287    |
|--------|---------|----------|----|----|----|------------|----------|--|--------------|---------|--------|
| TLM    | TOWC    | RESERVED |    |    |    | MESSAGE ID | DATA     |  | Satellite ID | CRC     | Tail   |
| 8 BITS | 17 BITS | 5 BITS   |    |    |    | 6 BITS     | 220 BITS |  | 6 BITS       | 24 BITS | 6 BITS |

The message format of the 220 bits of data of High Wave Alert is given below.

### Segment ID format

**Figure 1: Message Structure (220 Bits)**

### HWA Message (78 Bits) :

| Region | Between (Site 1) | Between (Site 1) | Wave Ht (min) | Wave Ht (max) | Current Speed (min) | Current Speed (max) | Date   | Time   | Validity | Msg Text |
|--------|------------------|------------------|---------------|---------------|---------------------|---------------------|--------|--------|----------|----------|
| 4bits  | 8bits            | 8bits            | 8bits         | 8bits         | 6bits               | 6bits               | 16bits | 11bits | 1bit     | 2bits    |

**Figure 2: HWA Message format (78 Bits)**

High wave alert Warning message contains information like Region (area between two locations), Wave Height, Current speed, Date, Time, Validity and Message.

Segment Count represents no of segments in the complete message and segment ID represents the number of the current segment. These are used if the message(s) length exceeds 220 bits.

### HWA Clear

Each warning message is associated with respective warning clear message that indicates the corresponding warning has been cleared. The warning clear indicator shall be as follows:

**Table 2: High wave alert warning Clear indicator**

| Message         | HWA Clear Bit |
|-----------------|---------------|
| Warning Present | 0             |
| Warning Cleared | 1             |

**Table 3: Message Contents**

| Item   | Details                     | Bits           | Remarks   |              |
|--|-----------------------------|----------------|---|--------------|
| Region   | Indicate a broad area       | 4 bits         | As given in table 9   |              |
| Sub region                                     | Site-1                      | 8 bits         | As given in table 10  |              |
|  | Site-2                      | 8 bits         |   |              |
| Wave Height<br>(Min=0m &<br>Max=20m)           | Wave Height minimum value   | 8 bits         | Need to represent in the format xx.x –<br>yy.y with 0.1m resolution |              |
|  | Wave Height maximum value   | 8 bits         |   |              |
| Current Speed<br>(Min=0 m/sec<br>&Max=5 m/sec) | Current Speed minimum value | 6 bits         | Represent in the form x.x m/sec with<br>0.1 m/sec resolution        |              |
|  | Current Speed maximum value | 6 bits         |   |              |
| Date   | Ddmmyy                      | 16 bits        | Date (DD) (1-31)  | 5 Bits (MSB) |
|  |                             |                | Month (MM) (1-12)   | 4 Bits       |
|  |                             |                | Year (YY) ( 1- 99)  | 7 Bits (LSB) |
| Time   | Hhmm                        | 11 bits        | Hour (HH) (0-24)  | 5 Bits (MSB) |
|  |                             |                | Minutes (MM) (0-60)   | 6 Bits (LSB) |
| Validity                                       | Upto 48 hrs                 | 1 bit          | 0 = 24hrs; 1 = 48hrs  |              |
| Msg Text                                       | Four types of messages      | 2bits          | Table-7   |              |
|  | <b>Total</b>                | <b>78 bits</b> |   |              |

Based on the table-3 it is clear that one location information can be transmitted using 78 Bits. So in one message segment up to two locations can be served.

INCOIS will have the flexibility to transmit the High wave alert information in different segments (up to 10 segments of each 220bits) of a given message ID. The total message length can vary from 220bits (1segment) to 2200bits (10 segments). The transmission time will vary 12 sec to 120 sec (2 minutes) respectively.

### **Decoding Scheme:**

- Extract the sub frame data bits.
- Decode the 4 bit service ID: 0111 represents High Wave
- **Segment count:** 4 bit segment count represent the total number of segment in a message.
- **Segment ID:** The 4 bit segment ID represents the Id of a segment being transmitted in a given message.
- **Region:** Extract the 4 bit value and identify the region as given in Table-9.
- **Sub region:** Extract 8 bit (Site-1) and 8 bit (Site-2) value and identify the location as given in Table -10.
- **Wave Height Min & Max:** Convert 8 bits to decimal to obtain a 3 digit value. Place decimal point after second digit from left. ( eg xx.x ).Eg: 2.7 is converted to 27 and 27 is converted to 8 bit binary equivalent.
- **Current speed Min & Max:** Convert 6-bits binary to decimal value. Place decimal point after first digit from left. ( eg x.x ). Since the max value is 5, we have converted the value to a 6 bit binary.E.g.2.5 is converted into 25 and 25 is converted to 6 bit binary value.
- **Date (DDMMYY):** convert binary to decimal

**Table 4: Date Format**

| DD/MM/YY           | Bits         |
|--------------------|--------------|
| Dates (DD) (1-31)  | 5 bits (MSB) |
| Months (MM) (1-12) | 4 bits       |
| Year (YY) ( 1- 99) | 7 Bits (LSB) |

- **Time: HHMM:** convert binary to decimal

**Table 5: Time Format**

| Time                | Bits    |
|---------------------|---------|
| Hour (HH) (0-24)    | 5 (MSB) |
| Minutes (MM) (0-60) | 6 (LSB) |

- **Validity:** Convert 1 bit binary message to decimal to obtain the validity period of High wave alert.

**Table 6: Validity Format**

| Valid Hours | Code |
|-------------|------|
| 24          | 0    |
| 48          | 1    |

- Alert message:

**Table 7: Alert Message**

| Message   | Code |
|---|------|
| Fishermen not to venture into open seas   | 00   |
| Fishermen at Sea not to come to the ports in the coast of _____<br>{2 regions at max will be given} | 01   |
| Fishermen to be cautious while going out in the sea   | 10   |
| Fishermen are advised to return to coast  | 11   |

In case Alert message code is “01” Port name will be transmitted in 8 bits (First 4 bits represents First Port Name and Last 4 bits represents Second Port Name) as given in Table 8.

**Sample output message**

“Kerala” Coast between “Vizhinjam” and “Kasargod”

Wave Height: 2.7-3.2 m

Current Speed: 2.5 - 2.8 m/sec

Duration: 21-12-2017,17:30 Hrs to 23-12-2017,23:30Hrs

“Fishermen to be cautious while going out in the seas”

**Table 8: Port Name**

| Port Region       | Code |
|-------------------|------|
| North Gujarat     | 0000 |
| South Gujarat     | 0001 |
| North Maharashtra | 0010 |
| South Maharashtra | 0011 |
| Goa               | 0100 |
| Karnataka         | 0101 |
| North Kerala      | 0110 |
| South Kerala      | 0111 |

|                      |      |
|----------------------|------|
| North Tamil Nadu     | 1000 |
| South Tamil Nadu     | 1001 |
| North Andhra Pradesh | 1010 |
| South Andhra Pradesh | 1011 |
| Odisha               | 1100 |
| West Bengal          | 1101 |
| Andaman & Nicobar    | 1110 |
| Lakshadweep          | 1111 |

- Region:

**Table 9: Region Name**

|    |                     |
|----|---------------------|

| 8 BITS | 17 BITS | 5 BITS   |    |    | 6 BITS | 220 BITS   |      |  | 6 BITS | 24 BITS      | 6 BITS |

The message format of the 220 bits of Cyclone warning data is as given below.

#### ODD Segment

| 220 bits   |            |         |                |             |              |            |             |              |
|------------|------------|---------|----------------|-------------|--------------|------------|-------------|--------------|
| Service ID | Seg. Count | Seg. ID | Continuity Bit | Port Name-1 | CW 1 Message | CW 1 Clear | Port Name-2 | CW 2 Message |
| 4 bits     | 4 bits     | 4 bits  | 1 Bit          | 8 bits      | 103 bits     | 1 bit      | 8 bits      | 87 bits      |

#### Even Segment

| 220 bits   |            |         |                |              |            |             |              |            |            |
|------------|------------|---------|----------------|--------------|------------|-------------|--------------|------------|------------|
| Service ID | Seg. Count | Seg. ID | Continuity Bit | CW 2 Message | CW 2 Clear | Port Name-3 | CW 3 Message | CW 3 Clear | Spare Bits |
| 4 bits     | 4 bits     | 4 bits  | 1 Bit          | 16 bits      | 1 bit      | 8 bits      | 103 bits     | 1 bit      | 78 bits    |

**Figure 1: Cyclone warning alert structure (220 bits)**

#### Cyclone Warning Message (103 Bits):

| System Category | System Name | Lat | Lon | Date | Time | Direction | km | Location | Max. Wind Speed | Max. Wave Height | Max. Current Speed | Advice |
|-----------------|-------------|-----|-----|------|------|-----------|----|----------|-----------------|------------------|--------------------|--------|
| 3               | 6           | 9   | 10  | 16   | 11   | 3         | 11 | 11       | 7               | 8                | 6                  | 2      |

**Figure 2: Cyclone warning message format (103 bits)**

**Note:** If there are more than one cyclones two segments will be sent which can accommodate 3 CW messages. In odd segments, a part of the 2<sup>nd</sup> CW message will be sent and remaining part in the even segment. Continuity bit will be ‘1’ in case of multiple CW messages. Otherwise it will be ‘0’. In case there are only one CW message the last 95 bits in first subframe will be padded with ‘0’ and continuity bit will be ‘0’.

Segment Count represents no of segments in the complete message and segment ID represents the number of the current segment. These are used if the message(s) length exceeds 220 bits.

**Table 2: Message Contents**

| Item                      | Details  | Bits            | Remarks   |
|---------------------------|--|-----------------|---|
| System Category           | Cyclone Status   | 3               | Table 4   |
| System Name               | Cyclone Name   | 6               | Table 5   |
| Latitude                  | Latitude   | 9               | Represented in the format xx.x degrees with 0.1 degree resolution                                   |
| Longitude                 | Longitude  | 10              | Represented in the format xxx.x degrees with 0.1 degree resolution                                  |
| Date                      | DDMMYY   | 16              | Dates (DD) (1-31) : 5 bits (MSB)<br>Months (MM) (1-12): 4 bits<br>Year (YY) ( 1- 99) : 7 Bits (LSB) |
| Time                      | HHMM   | 11              | Hour (HH) (0-24) : 5 (MSB)<br>Minutes (MM) (0-60) : 6 (LSB)   |
| Direction                 | Position of cyclone wrt a location in the mainland or Island | 3               | Table 8   |
| Kilometer                 |  | 11              | Decimal Point is not required   |
| Location                  | Location   | 11              | Table 12  |
| Max Wind Speed<br>Max=120 | Maximum value of wind speed                                  | 7               | Decimal Point is not required   |
| Max Wave Height<br>Max=20 | Maximum value of wave height                                 | 8               | Represent in the format xx.x m  |
| Max Current Speed. Max=5  | Maximum value of current speed                               | 6               | Represented in the format x.x m/sec   |
| Advice                    | Advisory Message   | 2               | Table 9   |
|                           | <b>Total</b>   | <b>103 bits</b> |   |

Each warning message is associated with respective warning clear message that indicates the corresponding warning has been cleared. The warning clear indicator shall be as follows:

**Table 3: Cyclone Warning Clear indicator**

| Message         | Code |
|-----------------|------|
| Warning Present | 0    |
| Warning Cleared | 1    |

INCOIS will have the flexibility to transmit the Cyclone warning information in different segments (up to 10 segments of each 220bits) of a given message ID. The total message length can vary from 220bits (1segment) to 2200bits (10 segments). The transmission time will vary 12 sec to 120 sec (2 minutes) respectively.

#### **Decoding Scheme:**

- Decode the sub frame data completely.
- **Service ID:** Decode the 4 bit service ID. 1111 represents Cyclone Warning Message
- **Segment count:** 4 bit segment count represent the total number of segment in a message.
- **Segment ID:** The 4 bit segment ID represents the Id of a segment being transmitted in a given message.
- **Port Name:** Extract the 8 bit value and identify the Port Name from Table 11.
- **Kilometers:** Convert 11 bit binary value into decimal.
- **System Category:** Extract 3 bit system category and identify the cyclone category from Table 4.

**Table 4: System Category**

| Sl. No | Cyclone Status                 | Code |
|--------|--------------------------------|------|
| 0      | Low Pressure                   | 000  |
| 1      | Depression                     | 001  |
| 2      | Deep Depression                | 010  |
| 3      | Cyclone Storm                  | 011  |
| 4      | Severe Cyclone Storm           | 100  |
| 5      | Very Severe Cyclone Storm      | 101  |
| 6      | Extremely Severe Cyclone Storm | 110  |
| 7      | Super Cyclonic Storm           | 111  |

- **System Name:** Convert 6 bits to decimal. Identify the corresponding name in table 5.

**Table 5: System Name**

| Sl. No | Cyclone Name | Code   |
|--------|--------------|--------|
| 0      | --           | 000000 |
| 1      | Nisarga      | 000001 |
| 2      | Gati         | 000010 |
| 3      | Nivar        | 000011 |
| 4      | Burevi       | 000100 |
| 5      | Tauktae      | 000101 |
| 6      | Yaas         | 000110 |
| 7      | Gulab        | 000111 |
| 8      | Shaheen      | 001000 |
| 9      | Jawad        | 001001 |
| 10     | Asani        | 001010 |
| 11     | Sitrang      | 001011 |
| 12     | Mandous      | 001100 |
| 13     | Mocha        | 001101 |
| 14     | Biparjoy     | 001110 |
| 15     | Tej          | 001111 |

- **Latitude:** Convert latitude information given in binary to decimal (3 digits). Place the decimal point before the last digit.
- **Longitude:** Convert longitude information given in binary to decimal (4 digits). Place the decimal point before the last digit.
- **Date (DDMMYY):** Convert binary to decimal

**Table 6: Date Format**

| DD/MM/YY           | Bits         |
|--------------------|--------------|
| Dates (DD) (1-31)  | 5 bits (MSB) |
| Months (MM) (1-12) | 4 bits       |
| Year (YY) ( 1- 99) | 7 Bits (LSB) |

- **Time: HHMM:** Convert binary to decimal

**Table 7: Time Format**

| Time                | Bits    |
|---------------------|---------|
| Hour (HH) (0-24)    | 5 (MSB) |
| Minutes (MM) (0-60) | 6 (LSB) |

- **Direction:** Extract 3 bits and identify the cyclone category from Table 8.

**Table 8: Direction**

| Sl.No | Direction | Code |
|-------|-----------|------|
| 0     | S         | 000  |
| 1     | E         | 001  |
| 2     | N         | 010  |
| 3     | W         | 011  |
| 4     | NW        | 100  |
| 5     | NE        | 101  |
| 6     | SW        | 110  |
| 7     | SE        | 111  |

- **Location:** Convert 11 bits to decimal and identify the corresponding name in table 12.
- **Max wind speed:** Convert maximum wind speed information given in 7-bit binary to decimal (3 digits). Wind speed is represented in whole numbers without decimal point.
- **Max wave height:** Convert maximum wave speed information given in 8-bit binary to decimal (3 digits) and place the decimal point before the last digit.
- **Max current speed:** Convert maximum current speed information given in 6-bit binary to decimal (2 digits) and place the decimal point before the last digit.
- **Advisory Message:** Extract the two bits and identify the message from Table 9.

**Table 9: Advisory Message**

| Message   | Code |
|---|------|
| Fishermen not to venture into open seas   | 00   |
| Fishermen at Sea not to come to the ports in the coast of _____<br>{2 regions at max will be given} | 01   |
| Fishermen to be cautious while going out in the sea   | 10   |
| Fishermen are advised to return to coast  | 11   |

\*\* if the message is of code ‘01’, then the 8 bits reserved for Port name will be transmitted in 8 bits (First 4 bits represents First Port Name and Last 4 bits represents Second Port Name ) as given in **Table 11**.

- **Cyclone Warning Clear:** Extract 2 bit and identify the message from Table 10.

**Table 10: Cyclone Warning Clear indicator**

| Message         | Code |
|-----------------|------|
| Warning Present | 0    |
| Warning Cleared | 1    |

**Table 11 : Port Name**

| Sl No | Port Region          | Code |
|-------|----------------------|------|
| 1     | North Gujarat        | 0000 |
| 2     | South Gujarat        | 0001 |
| 3     | North Maharashtra    | 0010 |
| 4     | South Maharashtra    | 0011 |
| 5     | Goa                  | 0100 |
| 6     | Karnataka            | 0101 |
| 7     | North Kerala         | 0110 |
| 8     | South Kerala         | 0111 |
| 9     | North Tamil Nadu     | 1000 |
| 10    | South Tamil Nadu     | 1001 |
| 11    | North Andhra Pradesh | 1010 |
| 12    | South Andhra Pradesh | 1011 |
| 13    | Odisha               | 1100 |
| 14    | West Bengal          | 1101 |

|    |                   |      |
|----|-------------------|------|
| 15 | Andaman & Nicobar | 1110 |
| 16 | Lakshadweep       | 1111 |

**Format of the expected output message**

Cyclone/Ocean State warning associated with {System Category}, {Name}: {Nil},

System at {Lat} N, {Lon} E, {10}kms{SW} off {Location} on Date:DD/MM/YY

**Time:HH:MM.**

Maximum Wind Speed:{WindSpeed} m/s [but, display in Km/hr at the receiver end]

Maximum Wave Height:{Waveheight} m

Maximum Current Speed:{Current Speed} m/s

Advice:{Advice}

**Table 12: Locations**

| Code | Location                           |
|------|------------------------------------|
| 1    | Lakhpat, GUJARAT                   |

## ANNEXURE 4- INCOIS Tsunami warning message

The message structure for tsunami warning message is as given below:

**Table 1: Sub frame data structure**

| 1      | 9       | 26       | 27 | 28 | 30 | 31         | 37       |  | 257 | 263          | 287     |
|--------|---------|----------|----|----|----|------------|----------|--|-----|--------------|---------|
| TLM    | TOWC    | RESERVED |    |    |    | MESSAGE ID | DATA     |  |     | Satellite ID | CRC     |
| 8 BITS | 17 BITS | 5 BITS   |    |    |    | 6 BITS     | 220 BITS |  |     | 6 BITS       | 24 BITS |
|        |         |          |    |    |    |            |          |  |     |              | 6 BITS  |

The message format of the 220 bits of Tsunami warning data is as given below.

220 bits

| Service ID | Segment Count | Segment ID | Message  |
|------------|---------------|------------|----------|
| 4 bits     | 4 bits        | 4 bits     | 208 bits |

**Figure 1: Tsunami warning alert structure (220 bits)**

**Message (208 bits):**

| Service ID | Seg count | Seg ID | Total bytes | Bulletin advisory No | Date    | Threat Status | Time    | Magnitude | Lat.    | Long.   | Spare  | Destination |
|------------|-----------|--------|-------------|----------------------|---------|---------------|---------|-----------|---------|---------|--------|-------------|
| 4 bits     | 4 bits    | 4 bits | 5 bits      | 8 bits               | 16 bits | 3 bits        | 11 bits | 7 bits    | 20 bits | 21 bits | 5 bits | 112 bits    |

**Figure 2: Tsunami warning message format (208 bits)**

The services IDs for different types of Tsunami warning messages are defined as follows:

**Table 2: Service ID and Type**

| Service Name | Service Type                   | Service ID |
|--------------|--------------------------------|------------|
| Tsunami      | Type 1: Earthquake information | 0001       |
|              | Type 2: Potential Tsunami      | 0010       |
|              | Type 3: Confirmed Tsunami      | 0011       |
|              | Type 4: Final Bulletin         | 0100       |

Segment Count represents no of segments (ranging from 1 to 10) in the complete message and segment ID represents the number of the current segment (ranging from 1 to 10).

### Tsunami Alert Message

The Tsunami alert / warning message broadcasted by INCOIS contains information regarding Bulletin advisory number, Date & Time, Threat status, Magnitude, Lat-Long, probable destinations etc.

The details of message structure are given below.

**Total bytes in the block:** 5 bits, to signify number of total bytes in each block

**Date:** DDMMYY

**Table 3: Date Format**

| DD/MM/YY     | Binary Code |
|--------------|-------------|
| Dates (1-31) | 5 bits      |
| Months(1-12) | 4 bits      |
| Year( up 99) | 7 Bits      |

**Threat status:** 3 Bits to specify whether it is general Earth quake information, Warning, Watch, All clear etc;

**Table 4: Threat status**

| Threat status    | Binary code |
|------------------|-------------|
| Earth Quake info | 000         |
| No Threat        | 001         |
| Alert            | 010         |
| Watch            | 011         |
| Warning          | 100         |
| All Clear        | 101         |

**Time: HHMM**

**Table 5: Time Format**

| Time          | Bits |
|---------------|------|
| Hour(0-24)    | 5    |
| Minutes(0-60) | 6    |

### Magnitude:

Maximum 10.0M : 7 Bits

### Latitude and Longitude

Latitude: 0-90 degree, converted to Seconds and represented in 19bits with additional 1 bit as MSB to denote N as '1' and '0' as South.

Hence 2.4 N in 20 bits is represented as 10000010000111000000

Longitude: 0-180 degree is converted to seconds and represented in 20bits , with one additional bit in MSB to represent E as '1' and W as '0' . 93.07 E in 21 bits represented as 101010001110011001100

**Table 6: Latitude & Longitude Conversion**

|                  | Decimal | Deg Min Sec | Seconds | Binary form           | No of Bits |
|------------------|---------|-------------|---------|-----------------------|------------|
| <b>Latitude</b>  | 2.4 N   | 2° 23' 60"  | 8640    | 10000010000111000000  | 20         |
| <b>Longitude</b> | 93.07 E | 93° 4' 12"  | 335052  | 101010001110011001100 | 21         |

**Destination:** Each State/District is represented as 8 Bits Binary code and it is mapped at the receiver. In a single segment, the no of destinations are 14 Nos. If more it follows in the next segment with the same frame structure.

### States

**Table 7: States**

| State Name        | Hex code |
|-------------------|----------|
| ANDAMAN & NICOBAR | 01       |
| ANDHRA PRADESH    | 02       |
| GOA               | 03       |
| GUJARAT           | 04       |
| KARNATAKA         | 05       |
| KERALA            | 06       |
| LAKSHADWEEP       | 07       |
| MAHARASHTRA       | 08       |
| ORISSA            | 09       |
| TAMIL NADU        | 0A       |
| WEST BENGAL       | 0B       |

## Districts

**Table 8: Districts**

|                       |    |
|-----------------------|----|
| KOMATRA ISLAND        | 0C |

| THANE              | 3E |
| RAIGARH            | 3F |
| GREATER BOMBAY     | 40 |
| GANJAM             | 41 |
| BALESHWAR          | 42 |
| BHADRAK            | 43 |
| KENDRAPARA         | 44 |
| JAGATSINGHPUR      | 45 |
| PURI               | 46 |
| KANNIYAKUMARI      | 47 |
| THOOTHUKUDI        | 48 |
| NAGAPATTINAM       | 49 |
| CUDDALORE          | 4A |
| KANCHEEPURAM       | 4B |
| RAMANANTHAPURAM    | 4C |

|                     |    |
|---------------------|----|
| CHENNAI             | 4D |
| THIRUVALLUR         | 4E |
| PUDUCHERRY          | 4F |
| VILLUPURAM          | 50 |
| KARAIKAL            | 51 |
| NAGAPATTINAM        | 52 |
| THANJAVUR           | 53 |
| TIRUNELVELI KATTABO | 54 |
| SOUTH 24 PARGANAS   | 55 |
| KOMATRA ISLAND      | 56 |

There should be a provision to add or delete or update these district/zones to suit future needs of Tsunami Service.

## ANNEXURE 5- INCOIS No Warnings/Alerts Message

The No Warning Message is intended to clear all the Alerts/Warnings messages that are given in **Message ID 21**.

| Service    | Service ID |
|------------|------------|
| No Warning | 1100       |

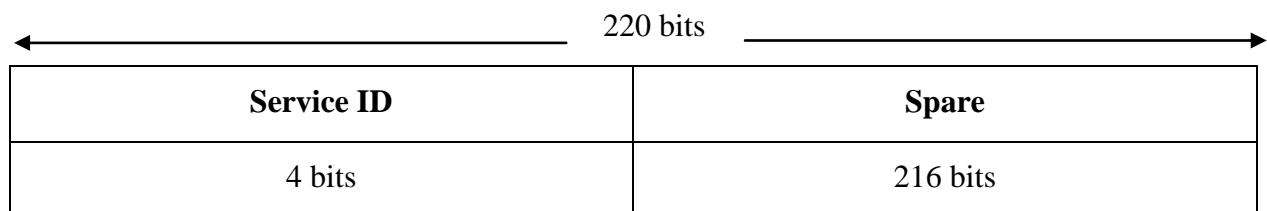

The message structure for No warning is as given below:

**Table 1: Sub frame data structure**

|        |         |          |    |    |            |          |    |              |         |        |
|--------|---------|----------|----|----|------------|----------|----|--------------|---------|--------|
| 1      | 9       | 26       | 27 | 28 | 30         | 31       | 37 | 257          | 263     | 287    |
| TLM    | TOWC    | RESERVED |    |    | MESSAGE ID | DATA     |    | Satellite ID | CRC     | Tail   |
| 8 BITS | 17 BITS | 5 BITS   |    |    | 6 BITS     | 220 BITS |    | 6 BITS       | 24 BITS | 6 BITS |

The message format of the 220 bits of data of No Warning / Alert Message is given below.

### Segment ID format

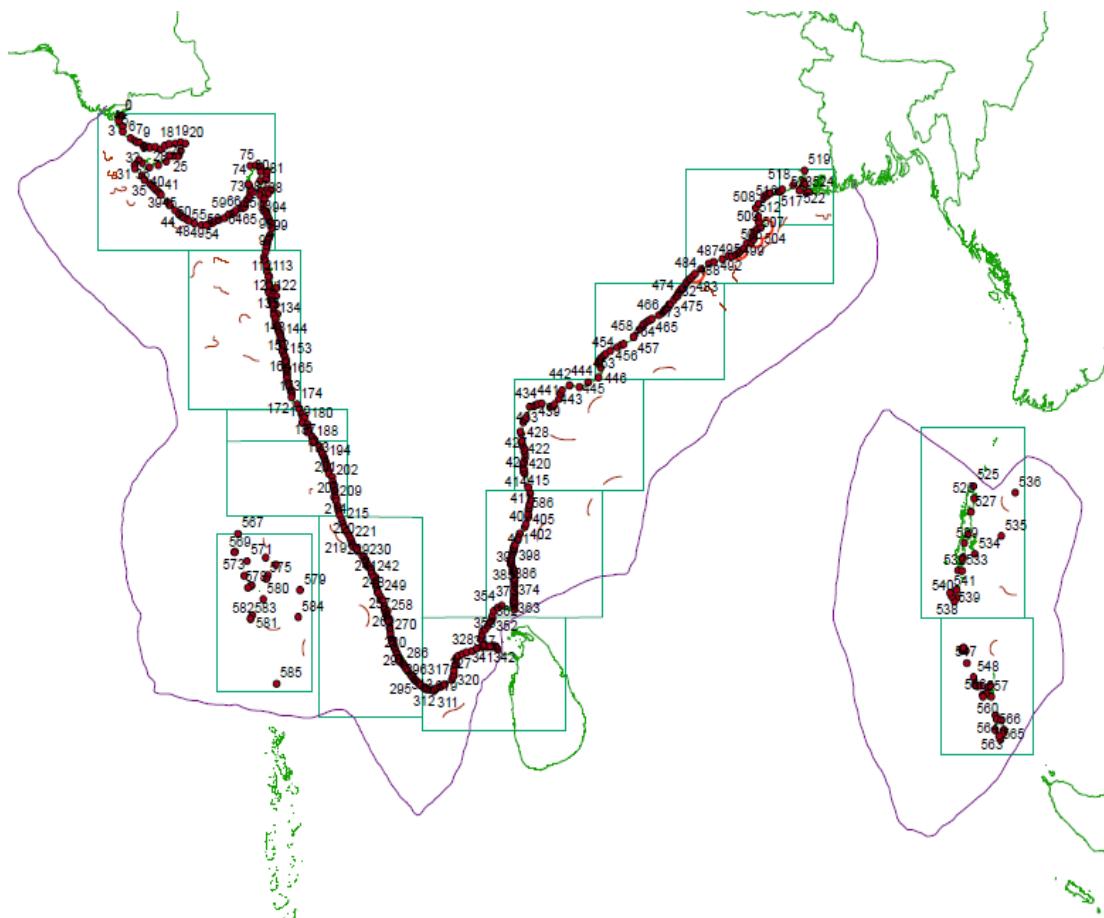

**Figure 1: Message Structure (220 Bits)**

- The No Warning Message contains only the 4bits Service ID (1100) and remaining all 216 bits will be 0's.
- All the Alerts/Warning messages associated with Message ID: 21 should be cleared as and when the above segment is received with Service ID: 1100.
- At the same time, the Message "***As of now, there are NO Warnings/Alerts***" should be displayed in the Mobile App Side.

## **ANNEXURE 6- INCOIS Potential fishing zone message/TUNA-PFZ**

The Potential Fishing Zone/ TUNA-PFZ message contains the following information: Latitude, Longitude, Ref ID & Step ID. The no.of zones can be maximum upto 800 zones. The sample forecast area definition given by INCOIS is as below:

IRNSS message structure (220 bits) is as given below:

Table 1: Sub frame data structure

| Table 1: Sub Frame data structure |         |          |            |          |              |         |        |  |
|-----------------------------------|---------|----------|------------|----------|--------------|---------|--------|--|
| 1                                 | 9       | 26       | 31         | 37       | 257          | 263     | 287    |  |
| TLM                               | TOWC    | RESERVED | MESSAGE ID | DATA     | Satellite ID | CRC     | Tail   |  |
| 8 BITS                            | 17 BITS | 5 BITS   | 6 BITS     | 220 BITS | 6 BITS       | 24 BITS | 6 BITS |  |

The message ID allocated for PFZ/TUNA-PFZ message is ‘20’. Total message length can vary from 220 bits (1 segment) to 2200bits (10 segments). The transmission time will vary 12 sec to 120 sec (2 minutes) respectively.

Each location's Latitude & Longitude can be represented bits 12 bits each with two digit decimal point (Lat variation 29.00N to 4.00S & Long variation 61.00-98.80). Each location with this option can be represented by  $12+12 = 24$  bits. Out of 800 PFZ/TUNA-PFZ locations the 9 locations can be served in single 220 bit message segment. The data structure for this is as given below:

The data structure for this is as given below:

| 220 bits       |                                 |        |                                       |                                       |      |                                       |
|----------------|---------------------------------|--------|---------------------------------------|---------------------------------------|------|---------------------------------------|
| Tuna/ Non Tuna | Last Subframe for PFZ/TUNA -PFZ | spare  | Location 1 Information                | Location 2 Information                | .... | Location 9 Information                |
| 1 bits         | 1 bits                          | 2 bits | 24 bits ( 12 bits lat + 12 bits long) | 24 bits ( 12 bits lat + 12 bits long) | .... | 24 bits ( 12 bits lat + 12 bits long) |

**Figure 1: Message Structure (220 Bits)**

Assuming 10 segment message total 90 PFZ/TUNA-PFZ locations can be served in total 120 sec (2 minutes). Again the same message ID data will be overwritten and transmitted for another 10 segments. Total transmission for all 800 Zones may take  $\approx 60$  minutes including message formatting delay, ground segment delay etc.

#### Decoding Scheme:

- Decoding the subframe data completely.
- Tuna fish locations will be indicated by 1 in “Tuna/ Non tuna” field. In this field 1 indicates all the mentioned 9 locations are indication for tuna fish. Check for Tuna/ non Tuna field and indicate the location of tuna and non tuna to fisherman
- Last Subframe for PFZ represented by “1”, otherwise this will be “0”. Last subframe may not be having 9 locations; In the last frame for a particular location if all 24 bits (Lat, Long) are zeroes , consider as no further location data.
- Spare bit is reserve for future use.
- Convert lat information given in binary to decimal (4 digit). Place the decimal point after second digit. Subtract 4 from the value. E.g. Lat 00.00 will represent -04.00 i.e. 4 S. This will cover from 4S to 29N and beyond.
- Convert long information given in binary to decimal (4 digit). Place the decimal point after second digit. Add 61 from the value. E.g. Long 01.00 will represent 62.00 E. This will cover from 61E to 98.8E and beyond.
- Overlapping the lat long information on to a graphical map by App.
- Identifying the fisherman's device location and showing the PFZ/TUNA-PFZ location the receiver by App.

## ACRONYMS

|       |   |
|-------|---|
| BPSK  | Binary Phase Shift Keying                   |
| CDMA  | Code Division Multiple Access               |
| CRC   | Cyclic Redundancy Check                     |
| dB    | Decibel                                     |
| FEC   | Forward Error Correction                    |
